Challenges & Lessoned Learned

I have experienced a lot of challenges while making this project. First, I needed to design it. It was the first time I have ever used Figma, so I have to create another mini-project to learn the basics before creating the QuickSell user-interface. Some challenges I faced there were Frames and Auto-layout. It was confusing to learn at first, but I realized that it acted similarly to flex boxes in CSS. So, I treated Frames like HTML `<div>`s with their display set to flex. It got easier after that. I learned that if you associate something you don't know with what you do know, it becomes easier to grasp.

Next, was learning SQL. I played around MariaDB/MySQL in another class we have, Information Management. There, we learned how databases worked, how to create tables, create columns, add rows, etc.

Next was learning PHP. I wanted to add a backend to my project to stand out, even if it wasn't a requirement, I still went with it. It was the first time I used PHP so it was confusing. I ended up learning the basic syntax and made a few mini-projects before making the main QuickSell project. Some include a feedback system, a social media feed system, a basic user registration form, and many more. I did this to learn the basics of procedural PHP. I used MySQLi to connect to my MariaDB database. It was easier to learn than PDO so I went with that. Eventually, I felt confident enough to start QuickSell. I learned how to use prepared statements for better security. I also learned that you need to hash passwords. Don't store plain passwords on the database! I also learned how to display content dynamically for the first time. I was able to create dynamic user profiles and feeds.

Next was the frontend. I finished the backend before styling the frontend. I ended up copying the designs I made in Figma for my frontend. I was the easy part of this whole thing, but I still faced a few issues. The biggest being organisation. It was a struggle to organise my code properly and even then the final project is still a bit messy.
